Suppose we see a die rolled 36 times with the following totals.

- H<sub>0</sub>: fair die
- How far does it deviate from uniform distribution?

Suppose we see a die rolled 36 times with the following totals.

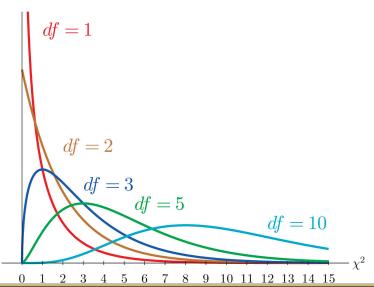

- H₀: fair die
- How far does it deviate from uniform distribution?
- $\chi^2$  distribution

## **Chi-Square Definition**

Let  $Z_1, ..., Z_n$  be independent random variables distributed N(0, 1). The  $\chi^2$  distribution with n degrees of freedom can be defined by

$$\chi_n^2 \equiv Z_1^2 + Z_2^2 + \dots + Z_n^2 \tag{1}$$

## **Chi-Square Definition**

### **Chi-Square Distributions**

## **PDF**

$$\frac{1}{2^{\frac{n}{2}}\Gamma(\frac{n}{2})}x^{\frac{n}{2}-1}\exp\{-x/2\}$$

### **CDF**

$$\frac{1}{2^{\frac{n}{2}}\Gamma\left(\frac{n}{2}\right)}\gamma\left(\frac{n}{2},\frac{x}{2}\right)$$

- $\gamma(s,x) \equiv \int_0^x t^{s-1} \exp\{-t\} dt$
- $\Gamma(()x) \equiv \int_0^\infty t^{x-1} \exp\{-t\} dt, \Gamma(n) = (n-1)!$

|          | 1 | 2 | 3 | 4 | 5 | 6 |
|----------|---|---|---|---|---|---|
| Observed | 8 | 5 | 9 | 2 | 7 | 5 |
| Expected | 6 | 6 | 6 | 6 | 6 | 6 |

- If this were a fair die, all observed counts would be close to expected
- We can summarize this with a test statistic

$$\sum \frac{(O_i - E_i)^2}{E_i} \tag{2}$$

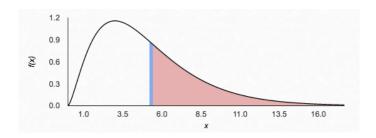

|          | 1 | 2 | 3 | 4 | 5 | 6 |
|----------|---|---|---|---|---|---|
| Observed | 8 | 5 | 9 | 2 | 7 | 5 |
| Expected | 6 | 6 | 6 | 6 | 6 | 6 |

- If this were a fair die, all observed counts would be close to expected
- We can summarize this with a test statistic

$$\sum \frac{(O_i - E_i)^2}{E_i} \tag{2}$$

- In our example, 5.33
- Approximately distributed as  $\chi^2$  with k-1 degrees of freedom

#### Test Statistic and p-value

- Expected value of  $\chi^2$  with df=5 is 5
- 5.33 is not that far away
- 0.38 probability of rejecting the null

#### **Degrees of Freedom**

- We condition on the number of observations (36)
- So after filling in the cells for five observations, one is known
- So total of k-1 degrees of freedom

## **Degrees of Freedom**

- We condition on the number of observations (36)
- So after filling in the cells for five observations, one is known
- So total of *k* −1 degrees of freedom
- Important because it specifies which  $\chi^2$  distribution to use
