

Probability Practice

Introduction to Data Science Algorithms
Jordan Boyd-Graber and Michael Paul

SEPTEMBER 1, 2016

Administrivia

- HW 1 Up, autograder available early next week
- Ask questions on Piazza
- · Office hours by appointment
- Python assumptions

Big Picture

- Probabilities
- Need to have intuitions for later models
- Key ideas: marginal distributions, independence

Marginal Probabilities

- A voter can either be a Democrat or Republican (f) and has an age (A)
 - p(F = D) = .45
 - p(A < 30, F = D) = .2, p(A < 30, F = R) = .1
 - p(A > 50, F = D) = .1
 - $p(30 \le a \le 50) = .3$

Marginal Probabilities

- A voter can either be a Democrat or Republican (f) and has an age (A)
 - $\circ p(F = D) = .45$
 - p(A < 30, F = D) = .2, p(A < 30, F = R) = .1
 - p(A > 50, F = D) = .1
 - $p(30 \le a \le 50) = .3$
- What is $p(30 \ge A \le 50, F = D)$?
- What is $p(30 \ge A \le 50, F = R)$?
- What is p(F > 50, F = R)?

Expected Value

In Las Vegas the roulette wheel has a 0 and a 00 and then the numbers 1 to 36 marked on equal slots; the wheel is spun and a ball stops randomly in one slot. When a player bets 1 dollar on a number, he receives 36 dollars if the ball stops on this number, for a net gain of 35 dollars; otherwise, he loses his dollar bet. Find the expected value for his winnings.

Expected Value

In Las Vegas the roulette wheel has a 0 and a 00 and then the numbers 1 to 36 marked on equal slots; the wheel is spun and a ball stops randomly in one slot. When a player bets 1 dollar on a number, he receives 36 dollars if the ball stops on this number, for a net gain of 35 dollars; otherwise, he loses his dollar bet. Find the expected value for his winnings.

$$35 \cdot \frac{1}{38} + -1 \frac{37}{38} =$$

In Las Vegas the roulette wheel has a 0 and a 00 and then the numbers 1 to 36 marked on equal slots; the wheel is spun and a ball stops randomly in one slot. When a player bets 1 dollar on a number, he receives 36 dollars if the ball stops on this number, for a net gain of 35 dollars; otherwise, he loses his dollar bet. Find the expected value for his winnings.

$$35 \cdot \frac{1}{38} + -1\frac{37}{38} = -0.052 \tag{1}$$

Expected Value

In a second version of roulette in Las Vegas, a player bets on red or black. Half of the numbers from 1 to 36 are red, and half are black. If a player bets a dollar on black, and if the ball stops on a black number, he gets his dollar back and another dollar. If the ball stops on a red number or on 0 or 00 he loses his dollar. Find the expected winnings for this bet.

Expected Value

In a second version of roulette in Las Vegas, a player bets on red or black. Half of the numbers from 1 to 36 are red, and half are black. If a player bets a dollar on black, and if the ball stops on a black number, he gets his dollar back and another dollar. If the ball stops on a red number or on 0 or 00 he loses his dollar. Find the expected winnings for this bet.

$$1 \cdot \frac{18}{38} - 1 \cdot \frac{20}{38} =$$

In a second version of roulette in Las Vegas, a player bets on red or black. Half of the numbers from 1 to 36 are red, and half are black. If a player bets a dollar on black, and if the ball stops on a black number, he gets his dollar back and another dollar. If the ball stops on a red number or on 0 or 00 he loses his dollar. Find the expected winnings for this bet.

$$1 \cdot \frac{18}{38} - 1 \cdot \frac{20}{38} = -0.052 \tag{2}$$

Is Entropy Non-negative?

We know that

$$\log p(x) \le 0 \tag{3}$$

Is Entropy Non-negative?

We know that

$$\log p(x) \le 0 \tag{3}$$

ff $0 \le x \le 1$. Thus,

$$-\log p(x) > 0. \tag{4}$$

Is Entropy Non-negative?

We know that

$$\log p(x) \le 0 \tag{3}$$

ff $0 \le x \le 1$. Thus,

$$-\log p(x) > 0. \tag{4}$$

And multiplying by a non-negative probability means

$$-p(x)\log p(x) \ge 0, (5)$$

so their sum is non-negative.
