Hypothesis Testing II

Introduction to Data Science Algorithms

Jordan Boyd-Graber and Michael Paul

OCTOBER 6, 2016

Details

- Important to pre-register hypothesis
- Check assumptions of tests
- Many other tests that are possible

Problems with Statistical Tests' Philosophy

- Failing to reject the null does not prove the null
- Cannot exclude data you don't like
- Confusing statistical significance with practical significance ($\mu \neq 0$ could mean $\mu = 0.000001$)

Problems with Statistical Tests' Philosophy

- Failing to reject the null does not prove the null
- Cannot exclude data you don't like
- Confusing statistical significance with practical significance ($\mu \neq 0$ could mean $\mu = 0.000001$)

Often better:

- Present plot with confidence intervals, let people decide for themselves
- Create comprehensive model with explainable parameters, compute intervals for parameters

Next time . . .

- Example of χ^2 test
- Computing sample variance
- Example of unpooled t-test
